

ABSTRACT OF THE DISCLOSURE

A multichannel image compression device comprises recording means for storing digital images on a plurality of channels in frames channel by channel  
5 into memories, control means for performing control in such a manner that the digital images stored by the recording means into the memories increase in number on a specific channel, and compression means for  
10 subjecting the digital images recorded by the recording means into the memories to compression coding by correlating frames channel by channel.
